

HTML Newspaper Recreation Assignment Explanation

Name: Mohsan Raza
Roll Number: 22P-9174

1. Code Structure Overview

This project recreates an old Urdu newspaper front page using only HTML5 and inline styling. The page is divided into major sections including the header, navigation strip, sidebar, main article area, and footer.

2. Key Sections Highlight

2.1 Header Section

The `<header>` tag is used for the masthead headline at the top of the newspaper. It contains the main translated headline styled with bold typography.

2.2 Navigation Strip

A `<nav>` section is placed below the masthead to represent the breaking news bar and edition label.

2.3 Table Layout for Columns

A `<table>` is used to divide the page into two main columns:

- Left sidebar (30%)
- Main content area (70%)

This helps achieve the traditional newspaper structure.

2.4 Article and Sections

The `<article>` and `<section>` tags are used for the main headline box and multi-column article text. The `column-count` property creates a realistic newspaper column flow.

2.5 Footer

The `<footer>` tag is included at the bottom for submission and course information.

3. Design Decisions

- Tables were chosen for accurate column alignment since external CSS was not allowed.
- Inline styles were used for borders, spacing, and newspaper-like formatting.
- Multiple images were included to match the original scanned front page layout.

4. Challenges Faced

The main challenge was maintaining a realistic multi-column newspaper appearance without external CSS files. This was solved using inline CSS properties such as `column-count`, spacing adjustments, and table-based layout.

This project follows all assignment rules: semantic HTML tags, proper structure, inline styling only, and accurate newspaper layout recreation.
